

Ubuntu Innovations (Pty) Ltd – IT Support Interview Questions & Sample Answers

1. Tell us about yourself and why you want to work for Ubuntu Innovations (Pty) Ltd.

I am an aspiring IT Support professional with knowledge of hardware installation, software deployment, network administration, cybersecurity, and backup management. Through projects such as the Ubuntu Innovations IT Support Infrastructure Capstone Project, I gained practical experience configuring networks, supporting users, planning backups, and implementing security controls. I am excited about joining Ubuntu Innovations because it is a growing technology company where I can contribute my technical skills while continuing to learn and develop professionally.

2. A user reports that they cannot access the internet. How would you troubleshoot the issue?

I would confirm the problem, check physical connections, verify IP configuration, test gateway connectivity, test internet access, verify DNS functionality, check network equipment, and document the solution. This helps isolate whether the issue is device, network, DNS, or ISP related.

3. What is Active Directory and why is it important?

Active Directory is Microsoft's directory service used to centrally manage users, computers, groups, and security policies. It provides centralized management, single sign-on, access control, and improved security.

4. Explain the difference between RTO and RPO.

RTO (Recovery Time Objective) is the maximum acceptable downtime after a disruption. RPO (Recovery Point Objective) is the maximum acceptable amount of data loss measured in time. These metrics guide backup and disaster recovery planning.

5. What is the 3-2-1 Backup Strategy?

The 3-2-1 strategy means keeping 3 copies of data, on 2 different storage media, with 1 copy stored offsite or in the cloud. It helps protect against hardware failure, ransomware, and disasters.

6. What cybersecurity measures would you recommend for a small business?

I would recommend MFA, antivirus protection, patch management, encryption, strong password policies, firewalls, regular backups, and employee security awareness training.

7. What is Multi-Factor Authentication (MFA) and why is it important?

MFA requires users to provide two or more forms of authentication before access is granted. It significantly reduces the risk of unauthorized access if passwords are compromised.

8. Explain encryption and where it is used.

Encryption converts readable data into an unreadable format that requires a key for access. It is commonly used for laptops, websites (HTTPS), VPNs, and backup storage.

9. What role does antivirus software play in cybersecurity?

Antivirus software detects, prevents, and removes malicious software. It provides real-time protection, scheduled scanning, and threat detection as part of a layered security approach.

10. What is risk management in IT and how would you apply it?

Risk management involves identifying, assessing, mitigating, and monitoring threats. Controls such as MFA, backups, endpoint protection, and security awareness training help reduce risk and support business continuity.
